

Popponesset Bay Watershed, Town of Mashpee

Popponesset Bay Watershed

- About 20 mi²
- About 100 acres of eel grass habitat in 1951; absent from estuary (1995-2001)
- Recharge to the groundwater system sole source of water
 - About 25 percent discharge to estuaries
 - About 33 percent discharge to streams
 - About 40 percent passes through a pond
- Total nitrogen load of about 80 Kg/day

Rasterization Process for Conversion of MEP Parcel-Scale Water Use Data

Parcel-scale water use data (from MEP)

Vector data

1) Parcels with RF mapped to model grids: regional and subregional

2) Area-weighted mean RF used to determine recharge

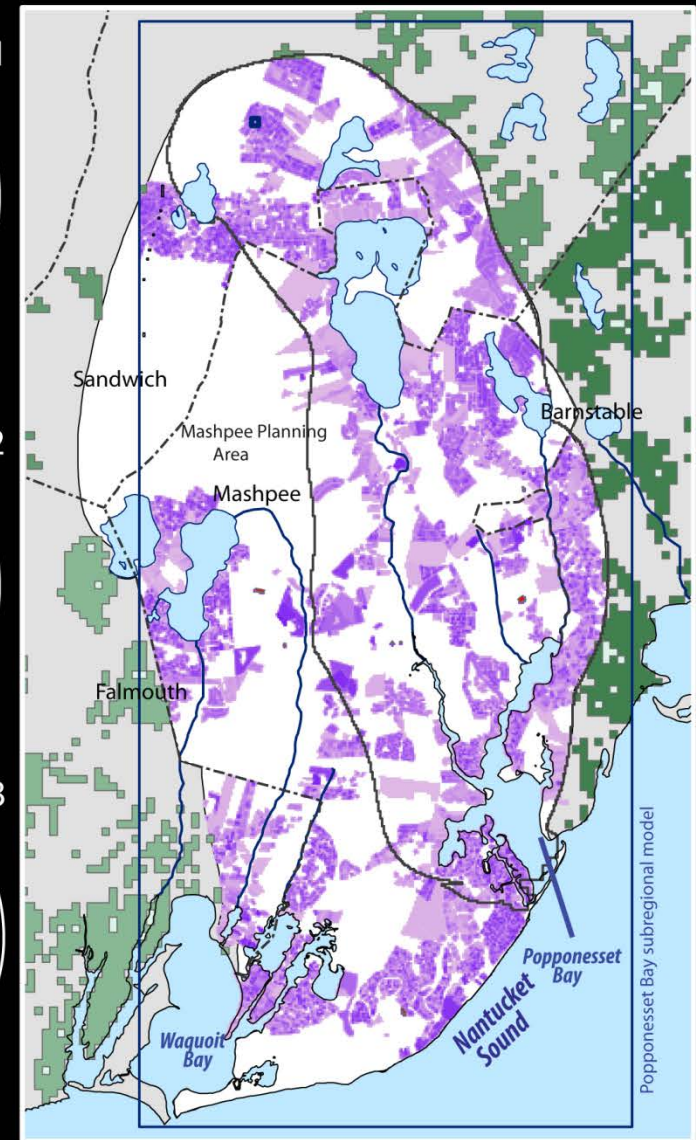

3) Nitrogen sources calculated from recharge and MEP assumptions

Subregional

Nitrogen source term for solute-transport simulations

Step 1

Step 2

Step 3

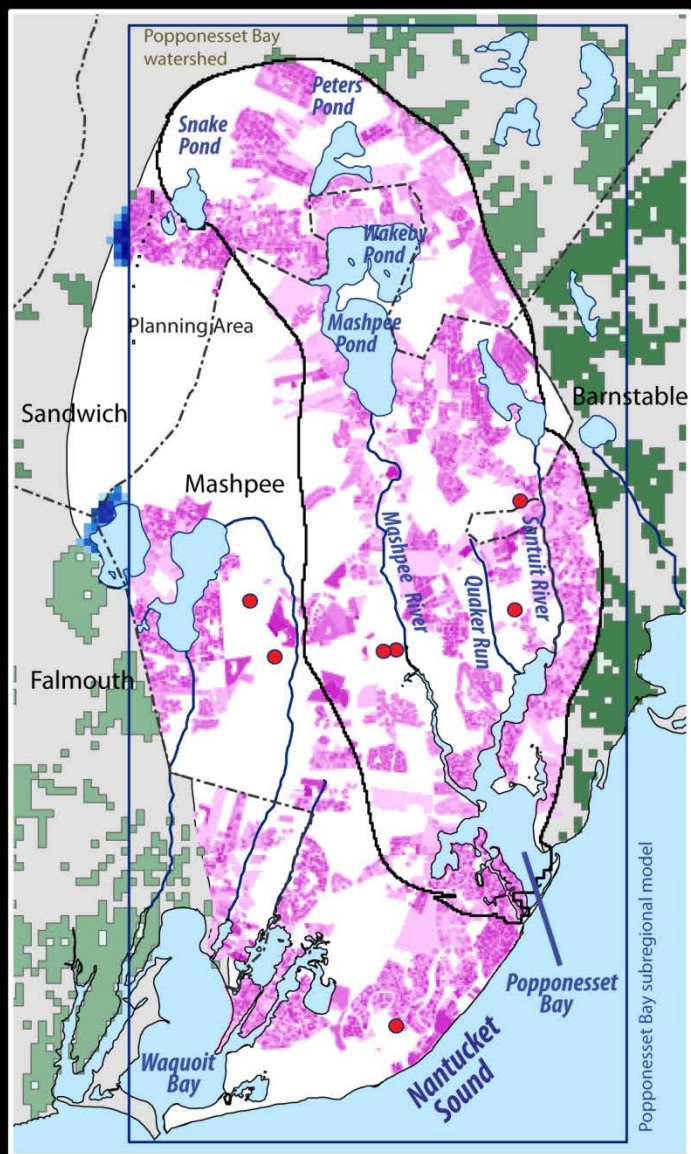

Regional

Assumptions regarding nitrogen transport:

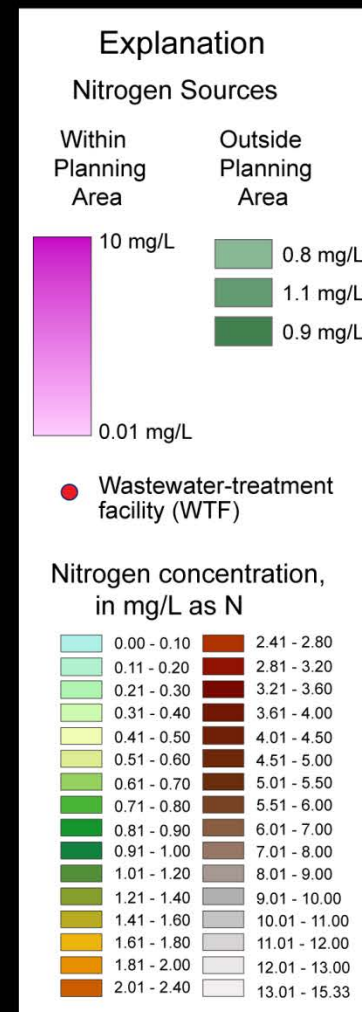

- Consumptive loss of 10 percent
- Nitrogen loss prior to recharge of 25 percent (septic systems and unsaturated zone)
- Conservative transport through the aquifer
- No loss within estuarine sediments
- Numerical dispersion approximates real dispersion

Nitrogen Sources and Simulated Nitrogen Concentrations after 30 Years of Transport

Nitrogen Sources for Current Conditions

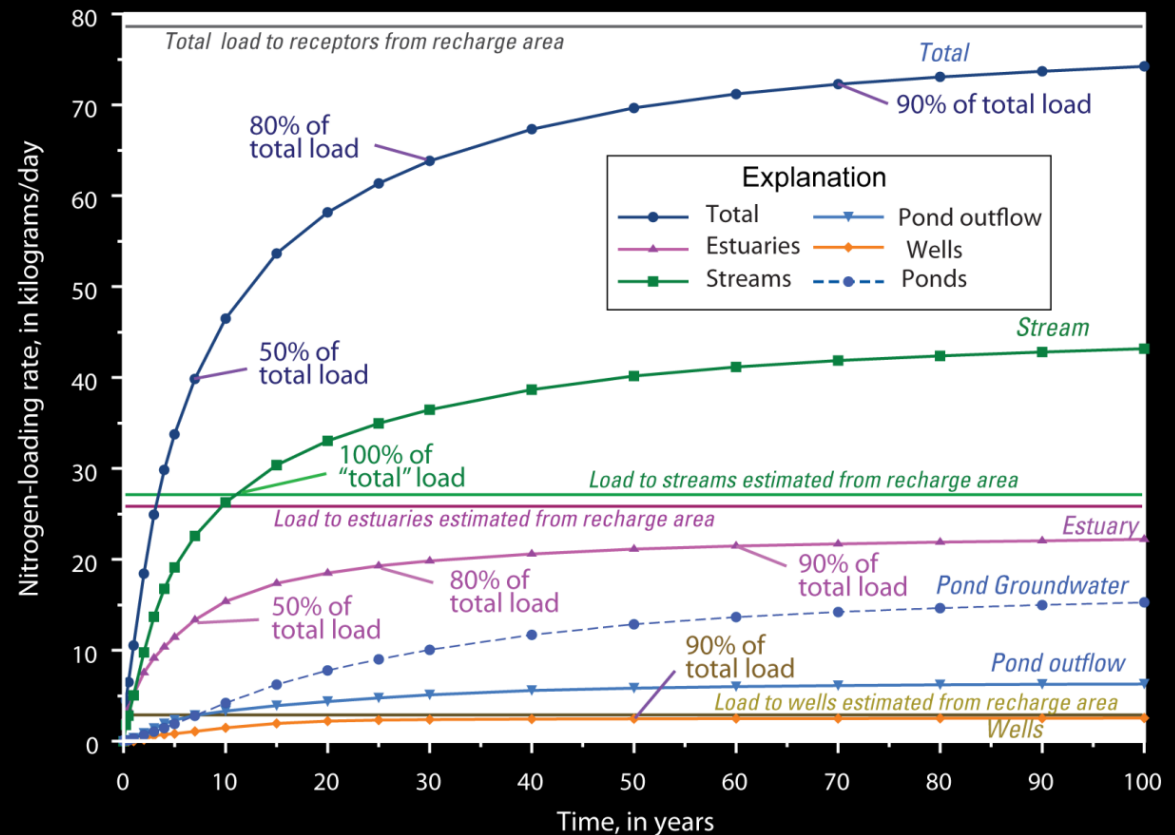

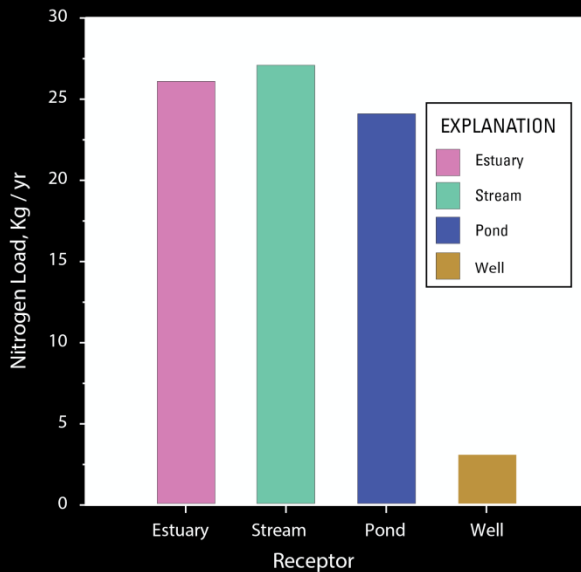

Simulated Nitrogen Concentrations, 0 to -10 feet Mean Sea Level

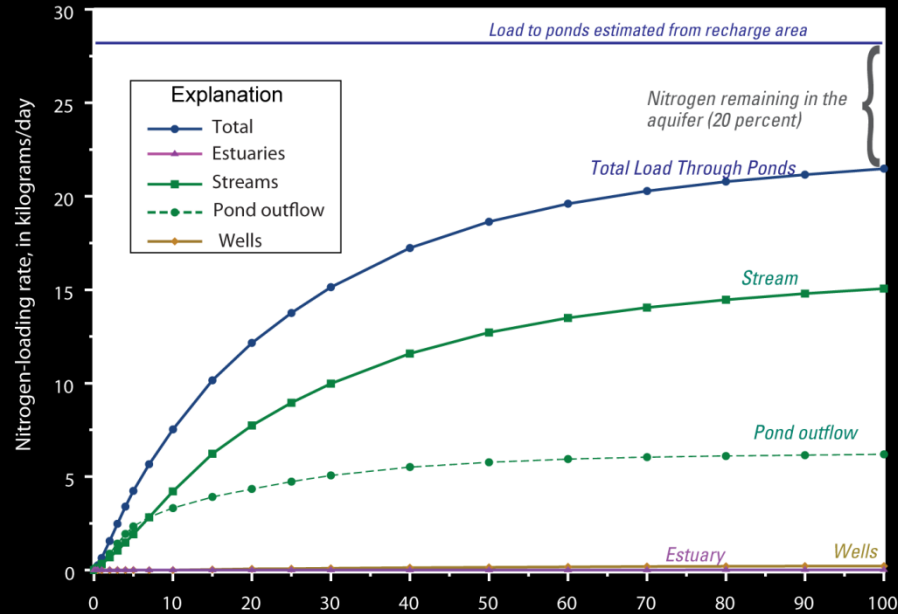

Nitrogen Concentrations, Central Popponesset Bay Watershed

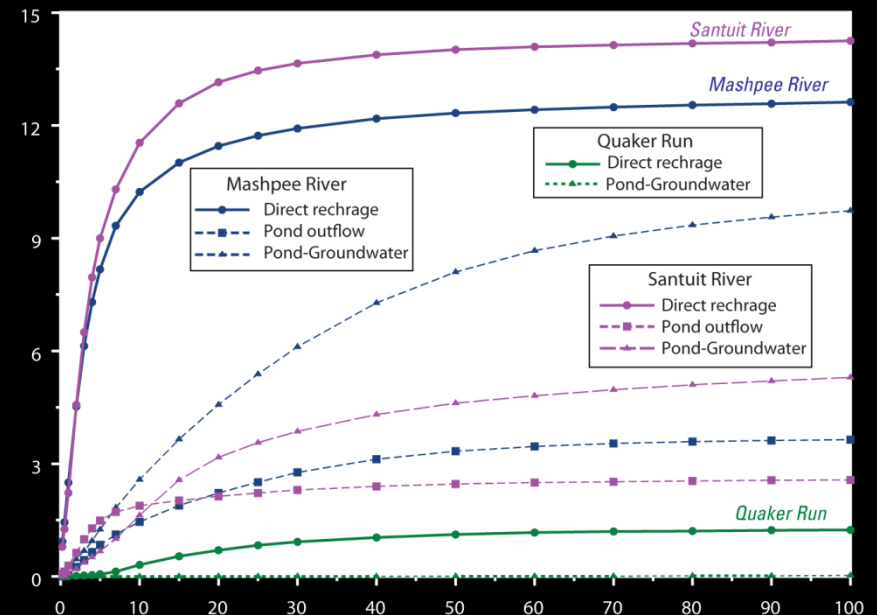

Comparison of Instantaneous and Time-Varying Nitrogen Loads

Complex Surface-Water Interactions, Ponds and Streams

- Groundwater flow through ponds can't be represented using delineated watersheds
- Additional attenuation can be accounted for by including these surface-water complexities

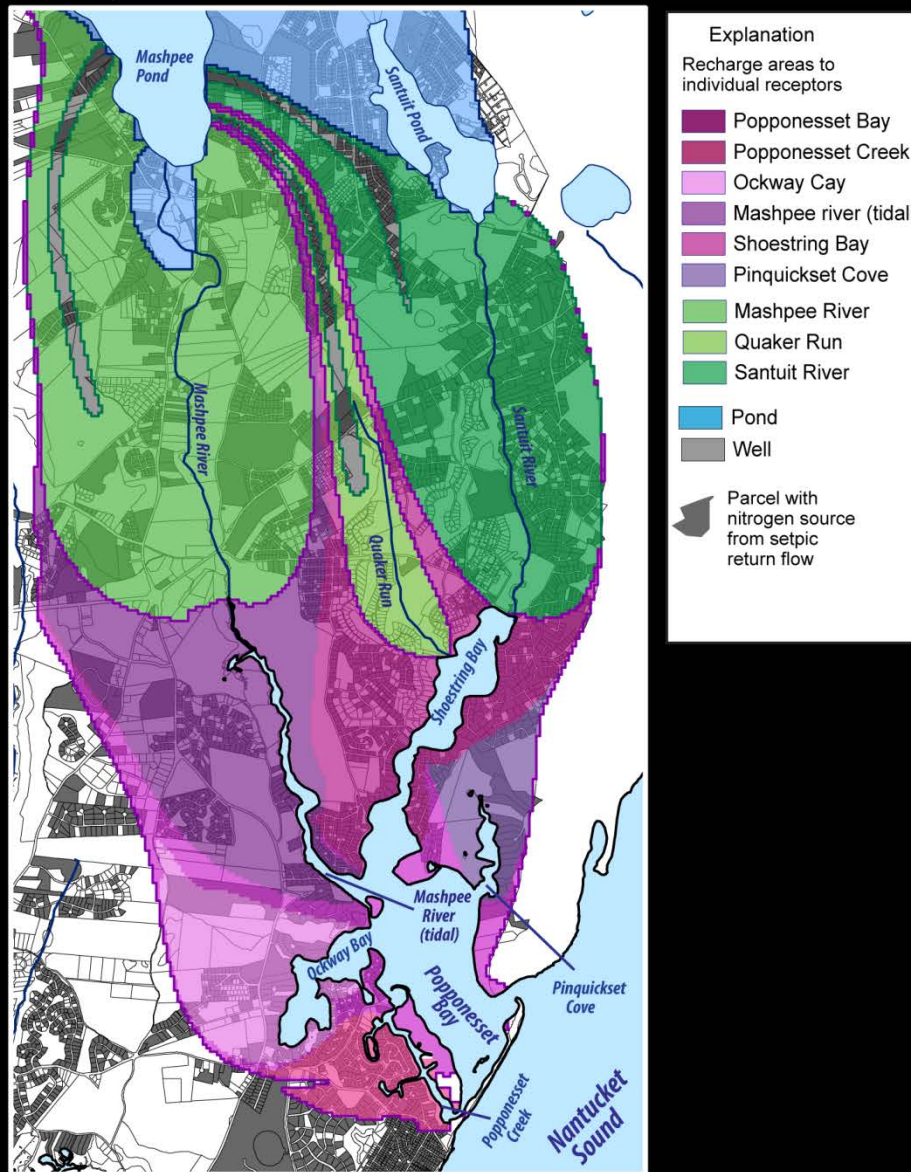

Evaluating Time-Varying Responses to Wastewater Management:

- Explicitly represents mass
- Accounts for changes in watershed boundaries in response to changing stresses
- Transport time fully integrated into simulation
- Ability to represent dispersion and attenuation
- Can simulate complex scenarios with linked management actions

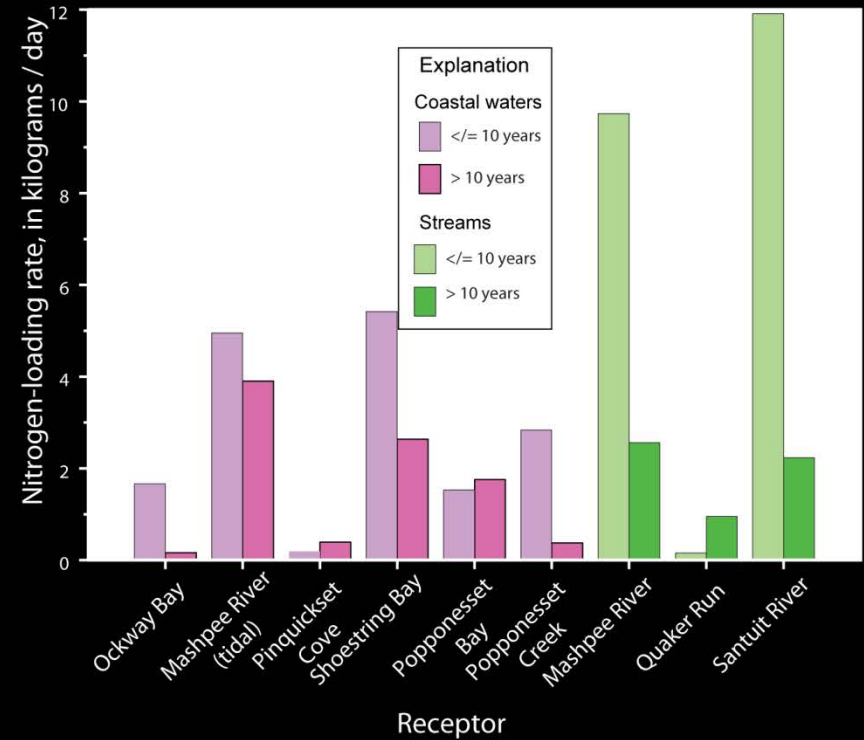

Recharge Areas to Streams and Estuaries and Estimated Current Nitrogen Loads

Recharge areas to streams and estuaries

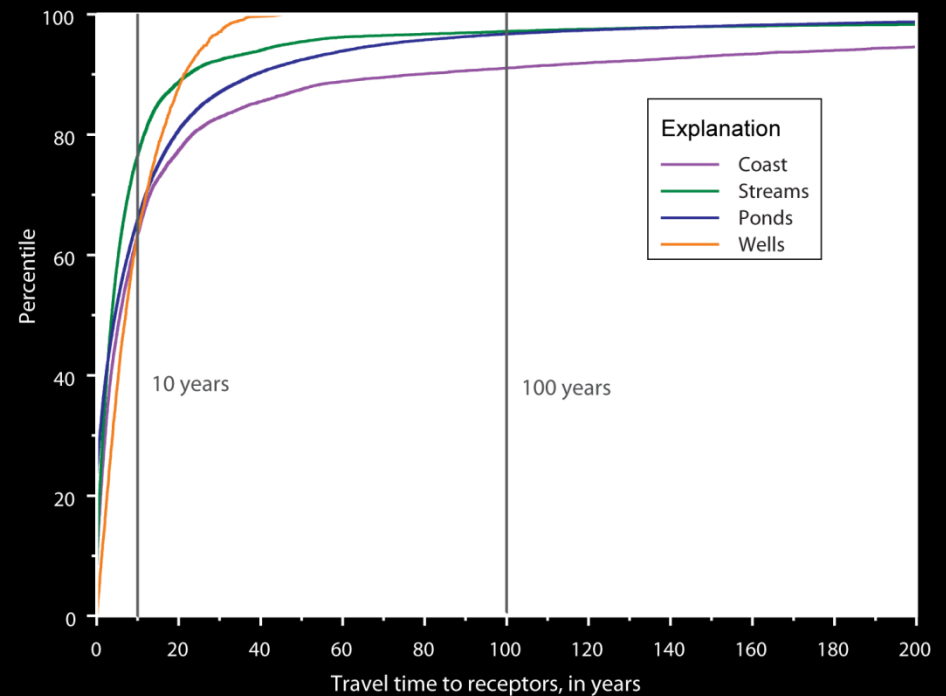

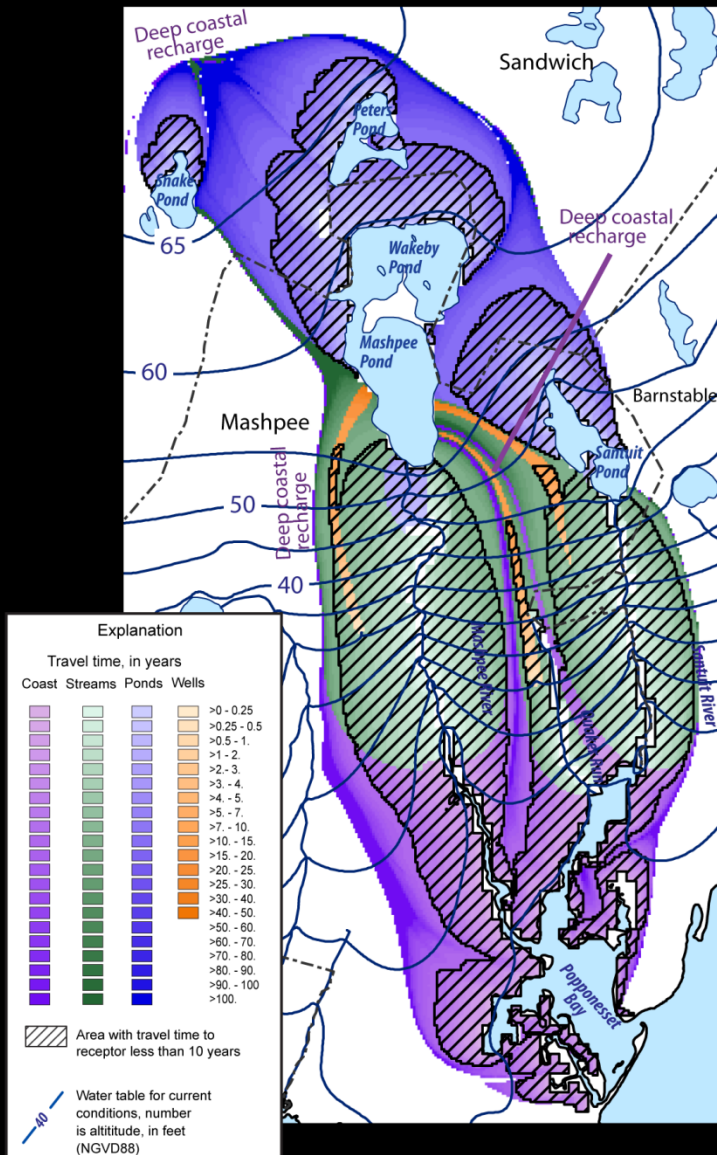

Nitrogen Loads Estimated by Summation of Sources Within Recharge Areas

Travel Times to Major Receptors, Popponesset Bay Watershed

Travel times, in years

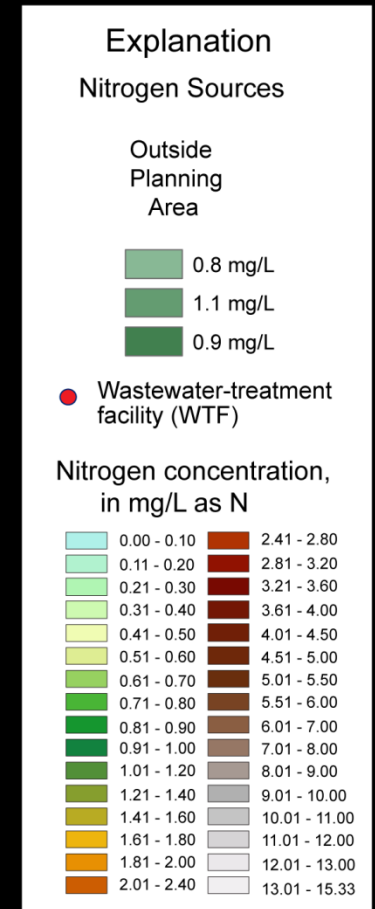

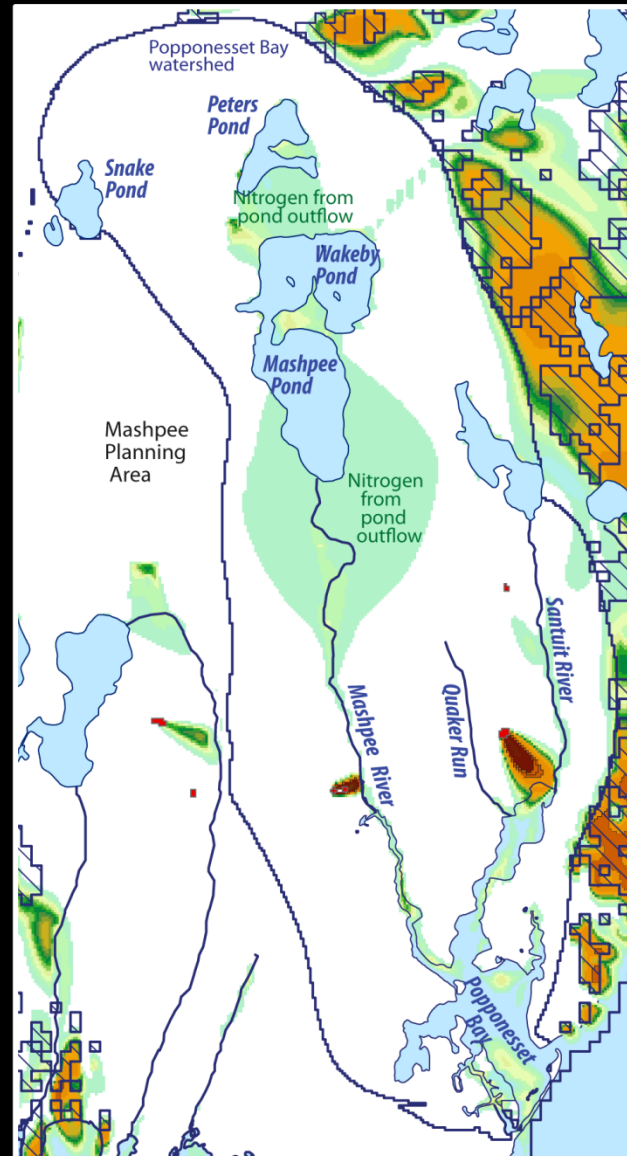

- Median travel times 4 to 6 years
- Transport primarily from advection
- Suggests rapid response in nitrogen loads

Nitrogen Sources and Simulated Nitrogen Concentrations after 30 Years of Transport

Nitrogen Sources for Full Sewering

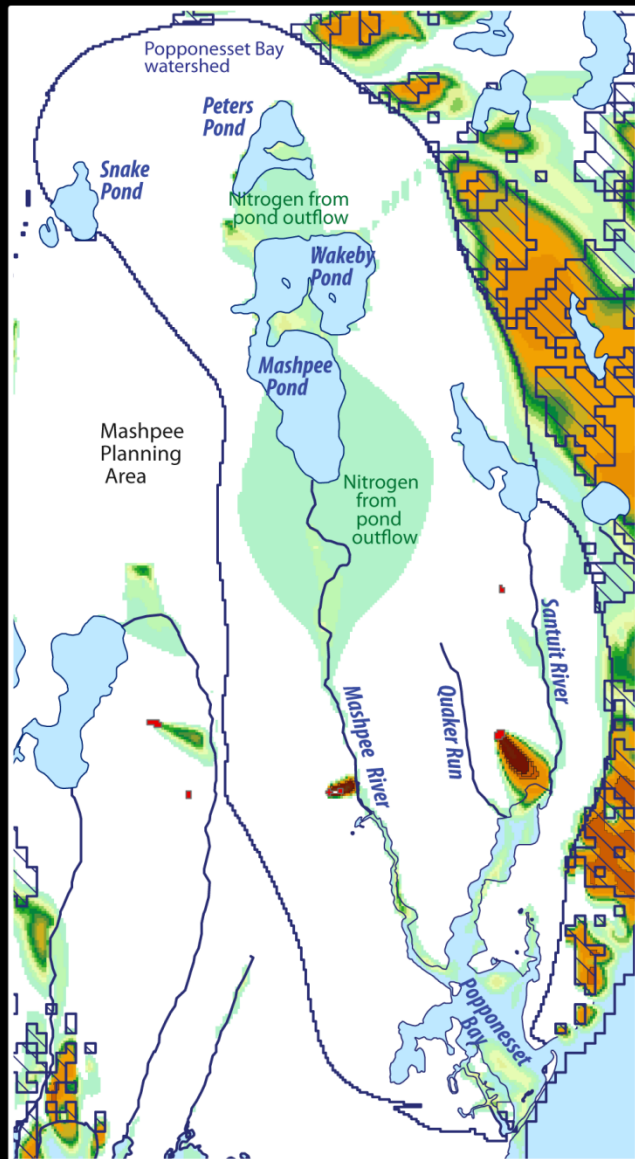

Simulated Nitrogen Concentrations, 0 to -10 feet Mean Sea Level

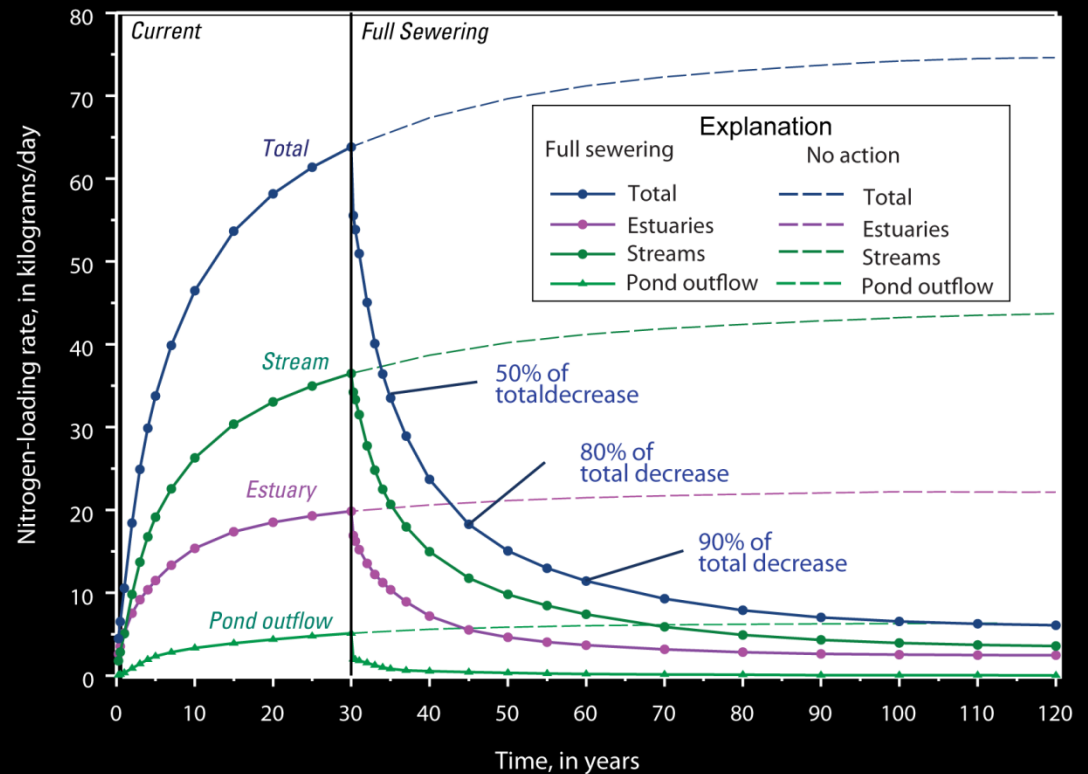

Response of Nitrogen Loads at Major Receptors to Full Sewering

Simulated Nitrogen Concentrations,
0 to -10 feet Mean Sea Level

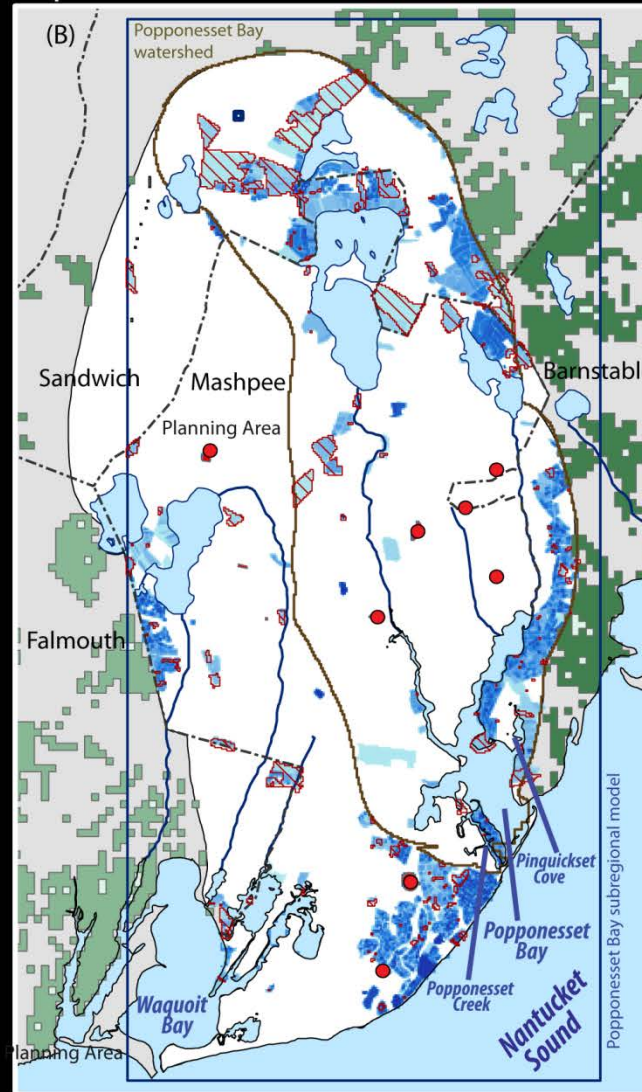

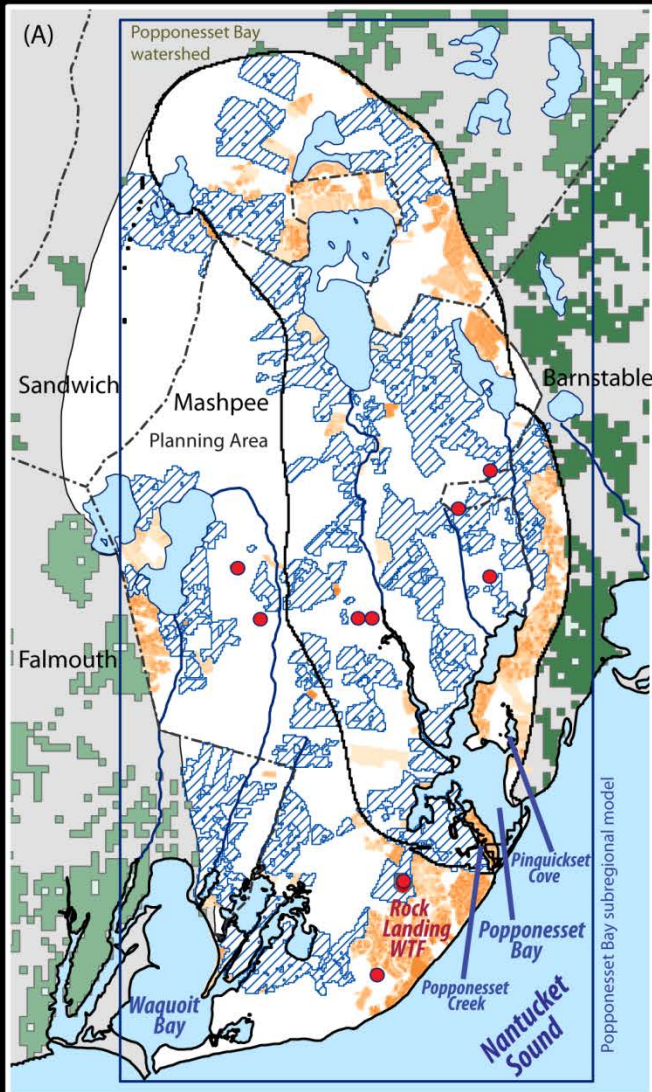

Response of nitrogen loads at major receptors to full sewerage

Complex (Multi-Phase) Wastewater-Management Actions

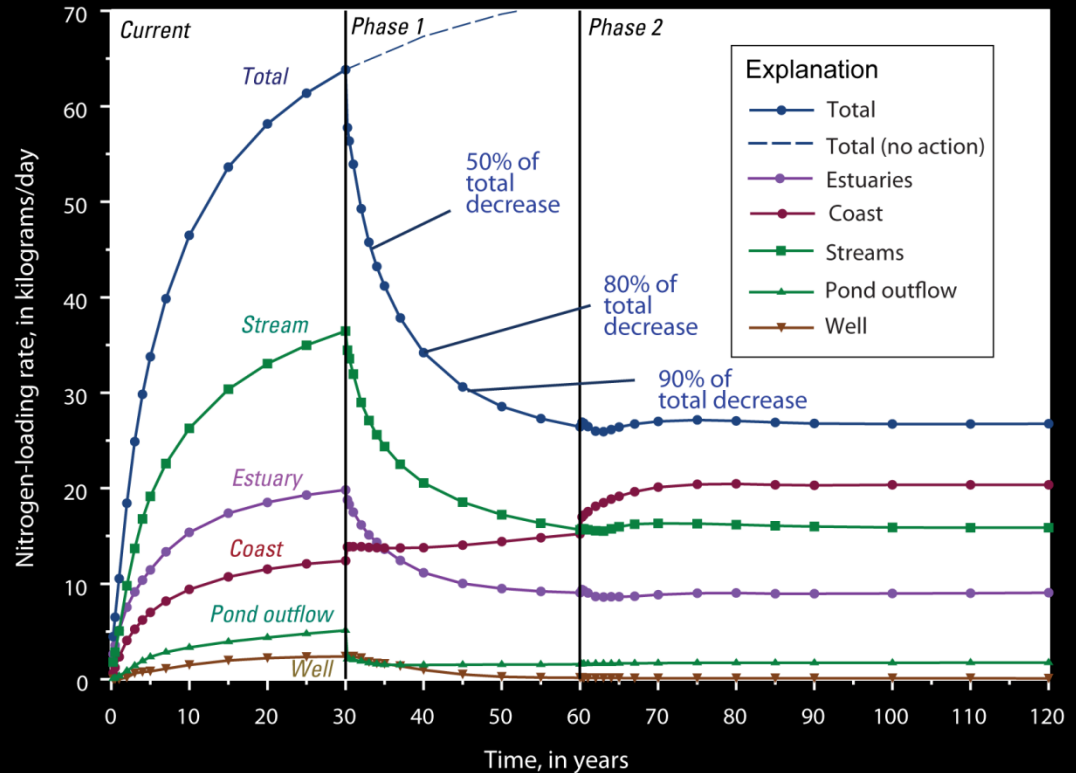

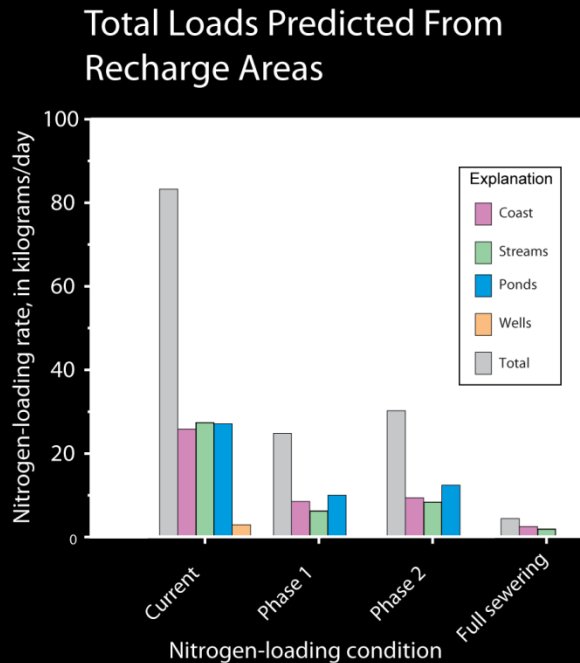

Phase 1: Partial sewerage and Disposal at WTFs

Phase 2: Build-out development and additional sewerage

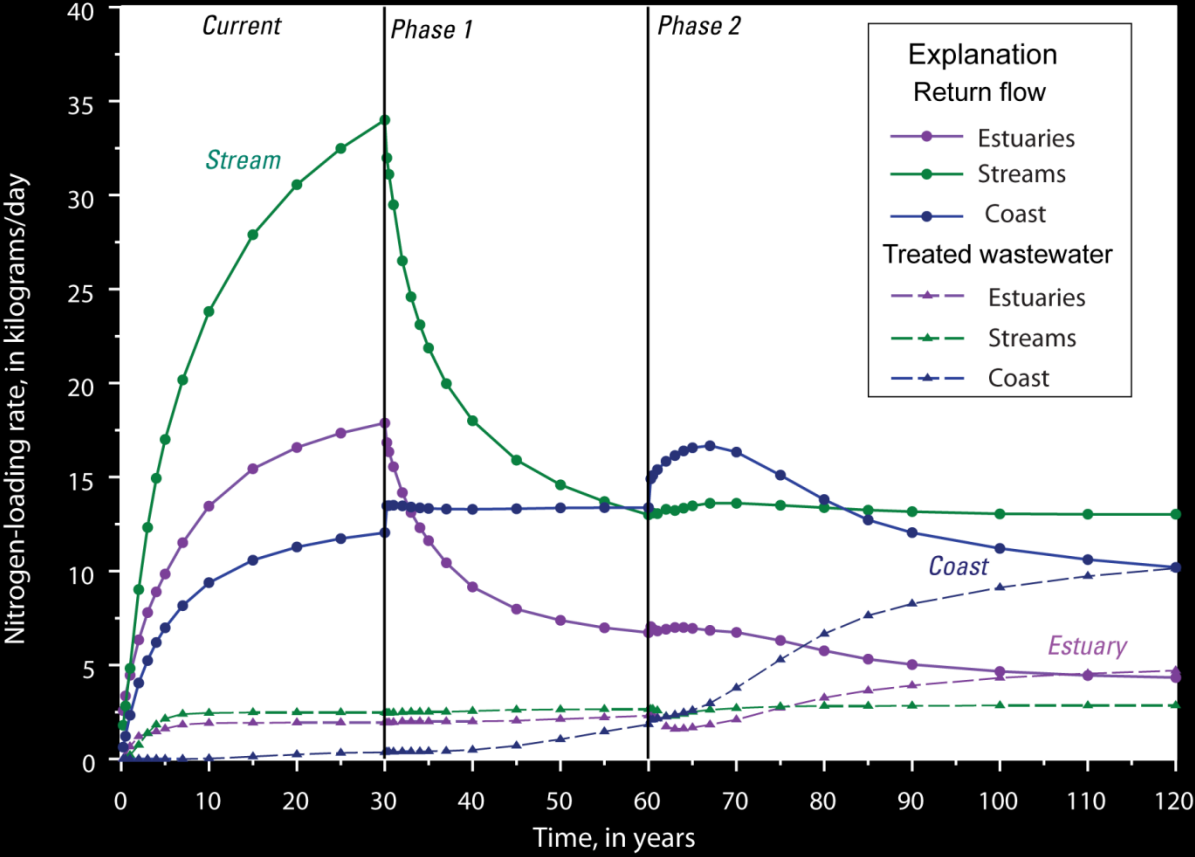

Response of Nitrogen Loads at Receptors to Two Phases of Wastewater Management

Response of nitrogen loads at major receptors to partial sewerage and disposal at wastewater-treatment facilities

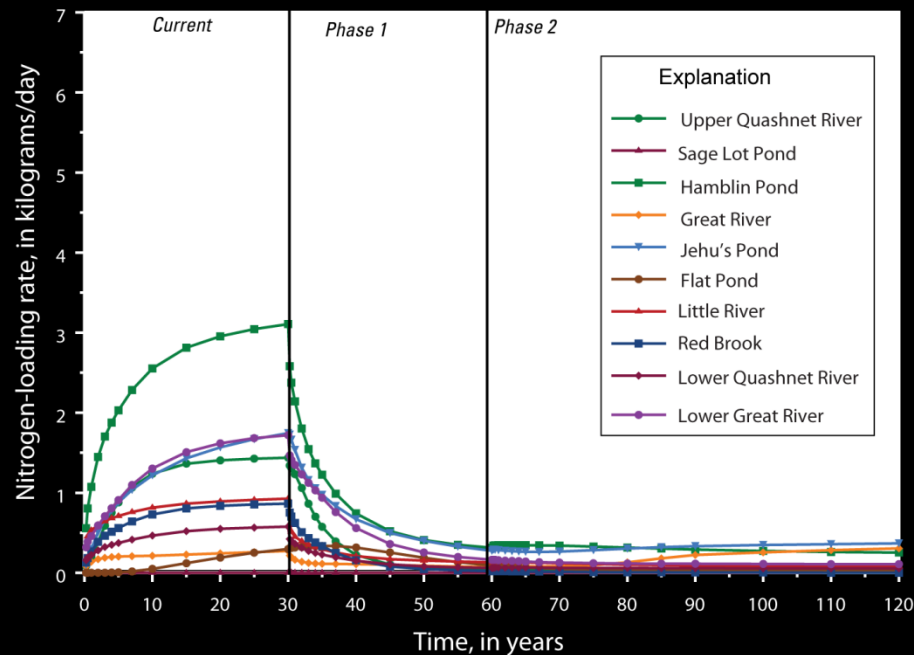

Response of Nitrogen Loads at Receptors to Two Phases of Wastewater Management: Return Flow and Wastewater Treatment

Response of Nitrogen Loads To Individual Estuaries to Wastewater Management : Direct Groundwater Discharge

Eastern Waquoit Bay Watershed

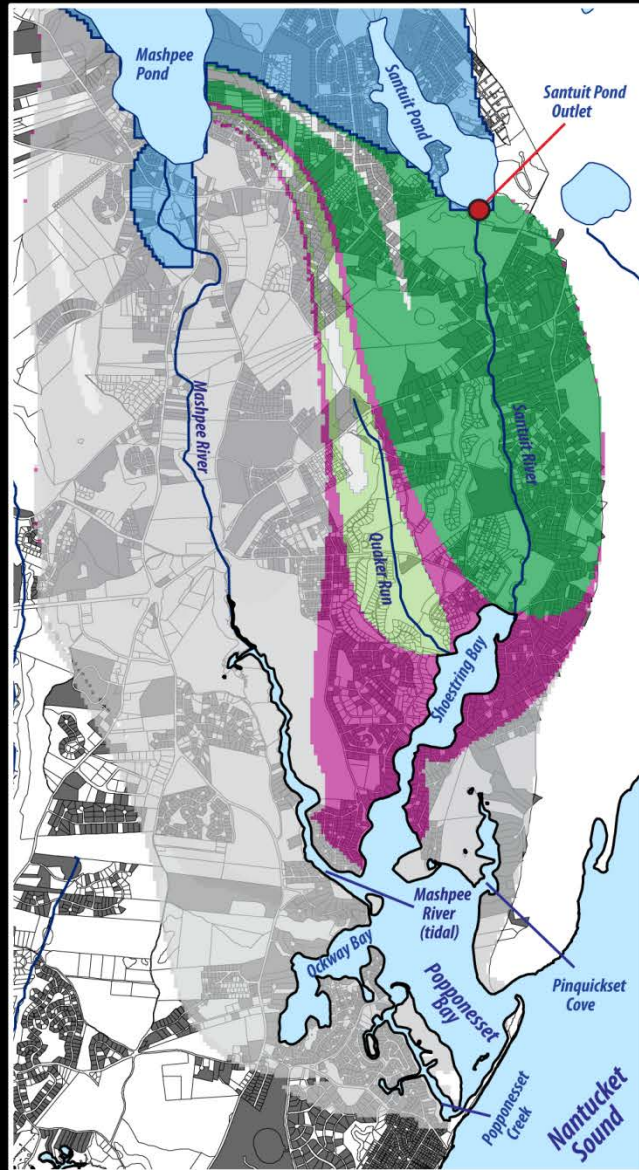

Popponeset Bay Watershed

Response of Nitrogen Loads in the Shoestring Bay System

Recharge areas to Shoestring Bay system

Response of nitrogen-load components

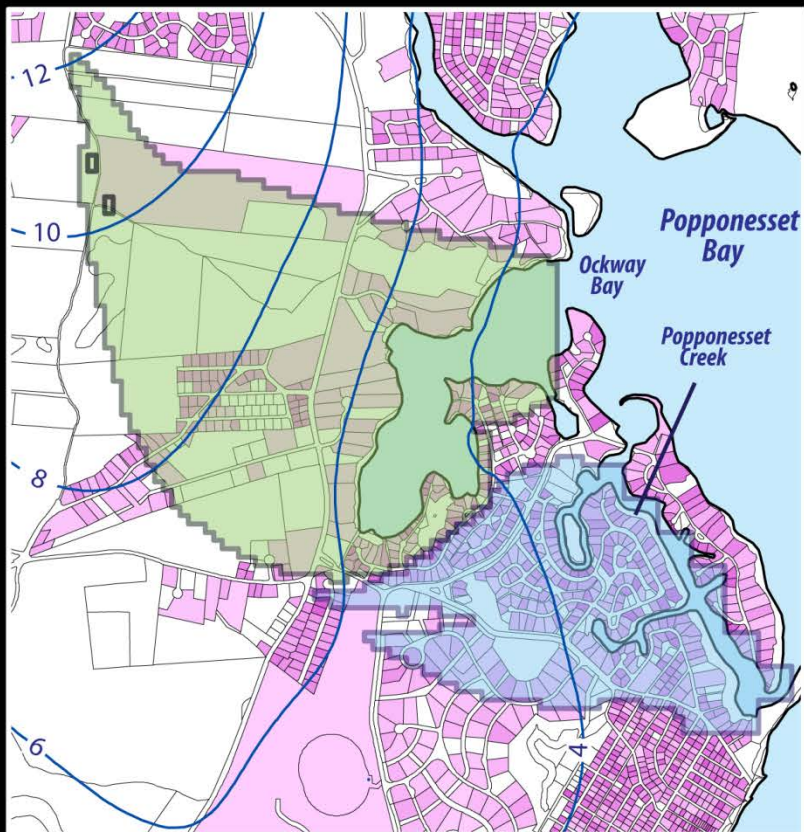

Accounting for Dynamic Watersheds:

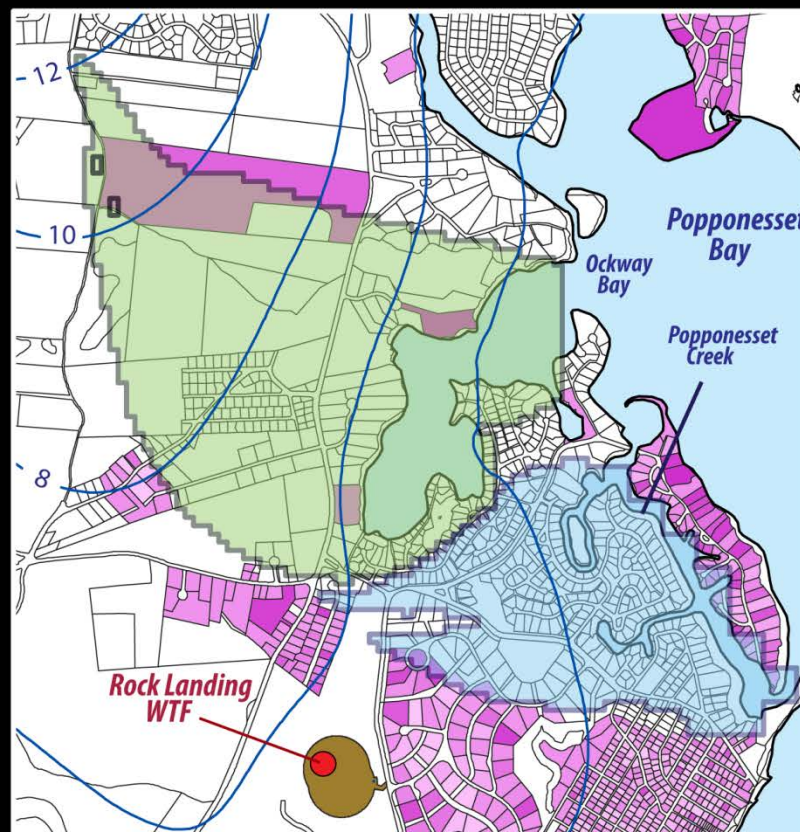

- MEP uses delineated watersheds for current conditions when evaluating future wastewater conditions
- Wastewater-managements actions (particularly centralized disposal) can change hydraulic gradients and recharge areas
- Inconsistencies between recharge areas and nitrogen sources can result in erroneous nitrogen-load estimates when evaluating TMDL compliance

Lessons Learned

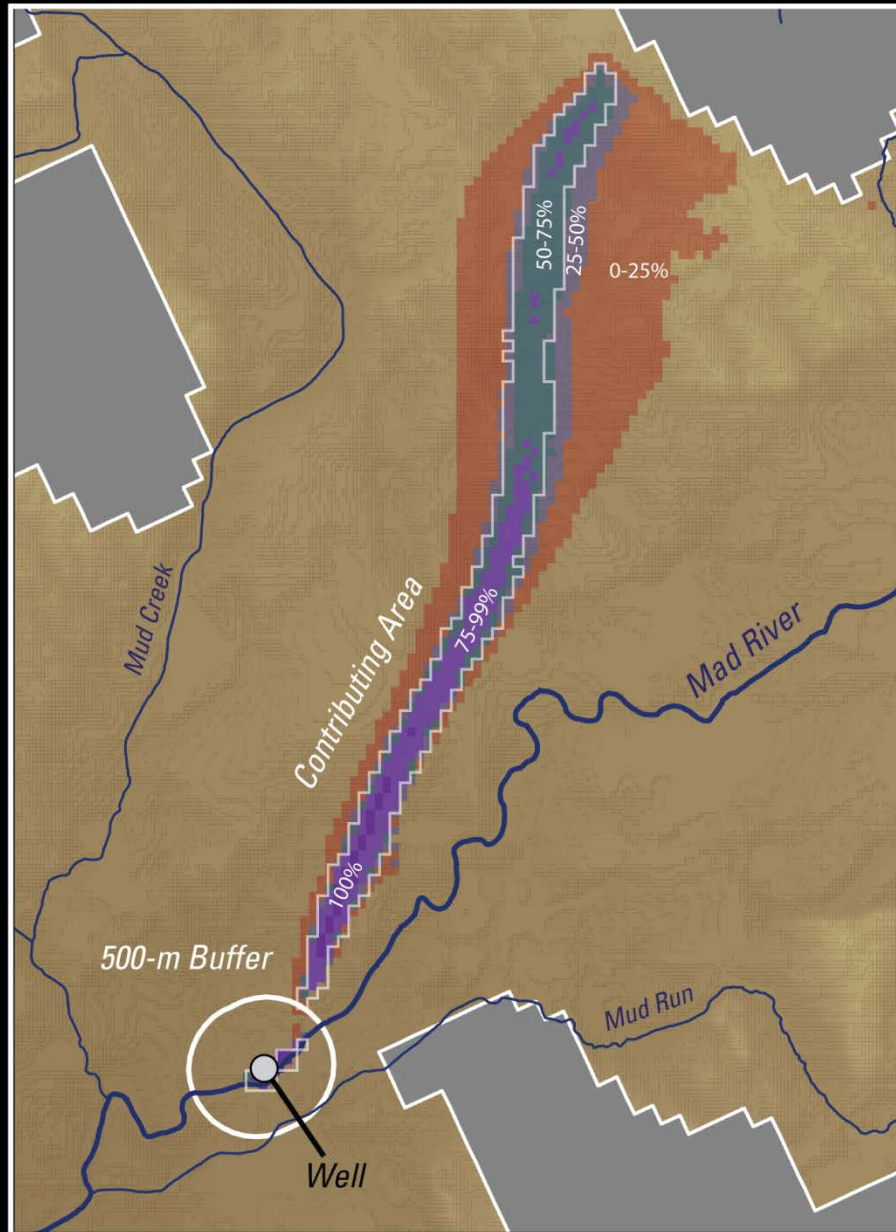

- Uncertainty in model predictions
- Potential underflow of nitrogen
- Nitrogen attenuation in estuarine sediments

Simulated Recharge Area to A Public Supply Well

- Simulated recharge areas, and predicted characteristics, are sensitive to model parameters
- Model uncertainties can be estimated using standard methods if a model is inversely calibrated

Probabilistic Recharge Areas and Prediction Uncertainties

- Recharge areas can be represented as probabilities to account for model uncertainty (Monte Carlo analysis)
- Derived model predictions, like mean nitrogen load, can be expressed as a population of predictions

Uncertainties Also Can Be Estimated for Transport Simulations

Underflow

- The transport of nitrogen underneath an estuary to offshore receptors would mean lower nitrogen loads
- The amount of nitrogen underflow is a function of a given conceptual model
- Can it vary for shallow or deep interface positions

Bottom of freshwater, current (2011) sea level position

Bottom of
Freshwater,
Altitude, in feet

0

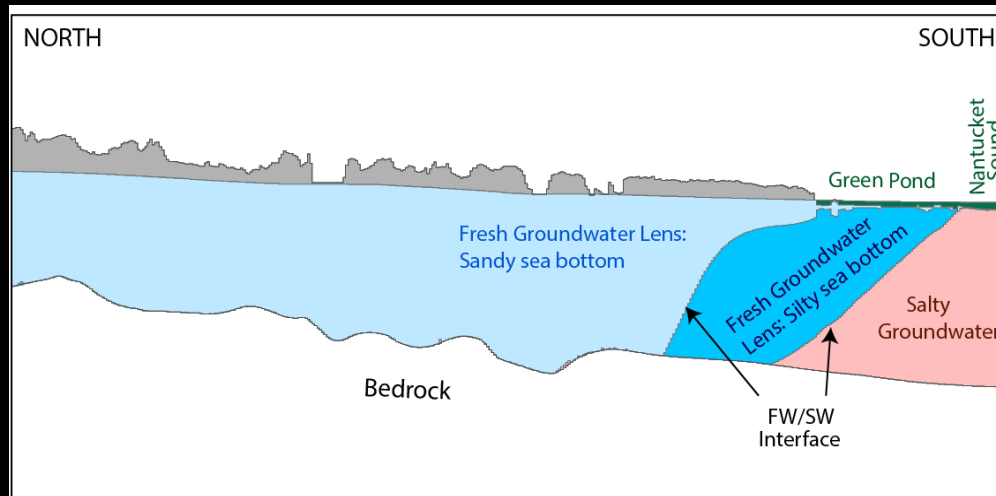

-520

Alternative Conceptualizations of the Fresh/Saltwater Interface

- The FW/SW interface a function of seabed leakance
- Deeper interfaces could allow for underflow of some of the nitrogen load
- GW flux at depth likely small and underflow may not be significant

Attenuation in Estuarine Sediments

- Assumptions of conservative transport may be reasonable in oxic, carbon-poor aquifers
- But nitrogen could be attenuated in geochemical environments within estuarine sediments
- Denitrification has been documented in these settings

Simple model (conservative)

Conceptual Models of Groundwater Discharge near Estuaries

Nauset Marsh Estuary
fresh under salt

- Local interface likely more complex
- Variable redox conditions
- Complex GW discharge
- Simplifying assumptions of nitrogen discharge may not be valid

Waquoit Bay
fresh under salt

Conceptual Models of Groundwater Discharge near Estuaries

Complex model

Investigation of Potential Nitrogen Attenuation, Eel River, Falmouth

- In cooperation with the EPA
- Evaluating N attenuation using wells and multi-level samplers
- Data collection in and near the Eel River

Investigation of Potential Nitrogen Attenuation, Eel River, Falmouth

Shoreline and Offshore Water Quality, Eel River

Application to Long Island GW System

- Different hydrography
- Longer travel times, instantaneous loads may be less valid
- Legacy land uses may be important
- Complex geology
