

NAME THAT MOLLUSK!

Can you match the mollusk to its description?

Mollusks are very important for the Peconic Estuary's water quality because some of them are filter feeders! Using two siphons (like straws), they drink up water to eat algae while also taking small particles and toxins out of the water. This improves water clarity which makes our estuary healthier!

Name: _____

Date: _____

1. This mollusk can swim and has up to 40 blue eyes that see light and dark!

2. This mollusk has a rough shell, can be found as a "reef" and creates pearls when they use mucus to coat a grain of sand or parasite that irritates their skin. The mucus hardens into a beautiful pearl!

3. This mollusk only has one shell which makes it a Univalve mollusk unlike a Bivalve mollusk which has two. This mollusk is a predator and eats other mollusks!
